Hose Replacement Service – 24h hour rapid response

Our 280 service vans from the hydraulic emergency service are always just a call away. Whether on the construction site, during the harvest or in industrial applications: in case of a machine failure the job is carried out on site – and around the clock.

Tel. 24/7: 0800 77 12345 (Int. +49 421 9897 7690)

Industrial Service – maintain and optimise

Your machines must be running, around the clock. Preventative maintenance of the HANSA-FLEX Industrial Services helps you to save money and guarantees maximum machine uptime. We will advise you from the selection of the right hydraulic components to the optimisation of your plant and machinery.

Power Unit Construction – engineering from the specialist

Units are the heart of any hydraulic system. In order to produce a state of the art power unit a high degree of engineering skill is required. The HANSA-FLEX power unit construction offers all services as a single source: from planning, design to installation and commissioning at the customer site.

X-CODE – hose management

Our customer portal My.HANSA-FLEX offers the perfect solution for preventative maintenance. Users can see the technical data of a hose line at a glance: Manufacturing date, period of use, proposed replacement date, as well as machine and location. Thus, inspection and maintenance intervals can be planned well ahead.

Products

Hydraulic hoses

Hose lines in all nominal diameters and for every field of application

Pipelines

Precision pipes conforming to DIN EN 10305, deliverable as single items or in series

Fittings production

Comprehensive range of fittings in stock, custom designs at very short notice

Fittings

On hand in many different dimensions and shapes; available in both steel and stainless steel

Adapters

Wide range of adapters for optimum flow conditions

High pressure flanges

Many designs in all standard alloys permanently in stock

Measuring systems

Extensive range of measuring systems for fluid technology

Mounting technology

Deliverable materials: Polypropylene, polyamide, solid rubber and aluminium

Bellows & expansion joints

Comprehensive warehouse inventory – fast delivery

Industrial hoses

Hoses, nipples, couplings for industrial applications in many sectors

Preformed hoses

Many standard sizes ex warehouse, custom designs for all geometries

Hydraulic cylinders

Many variants available in standard inventory, custom designs at short notice

Hydraulic components

More than 4,500 components available from stock – supply of ready-to-install groups

Plant construction

Innovative solutions in hydraulic drive and control technology

Services

Couplings

Available immediately from stock: couplings for every conceivable purpose

Rapid hydraulics service

Full-service mobile rapid hydraulics service – contactable at no charge, any time

Fluid service

Professional consulting and oil care, provision of filter systems and elements

Industrial assembly

Scheduled activities to avoid unscheduled stoppages

Metal & PTFE hoses

Special hose lines for solid, liquid and gaseous media

Cylinder repair

Manufacturer-independent repair of cylinders, pumps, motors and valves

Workshop containers

Mobile workshop containers for extreme application areas

Plant-in-plant production

Production facility at the customer's site – perfect synchronisation, rapid response times

Seals

Over 8,000 sealing systems in stock, custom designs available at short notice

Kitting

Ready-to-install, pre-assembled sets – individually adapted to the customer's needs

Kanban

All types permanently in stock – structured inventory maintained at customer's site.

Hose codes

Replacement parts procurement without delay with X-CODE – unique, fast

Technical consulting

Individual solutions tuned precisely to the needs of our customers

Hydraulic lines are capable of causing serious personal injury and environmental damage, but this danger is very often underestimated in practice. The wrong choice of hoses or improper use of hoses, hose lines, fittings and accessories can impair the functional safety of the product and lead to failure and hence personal injury or material damage. In extreme cases, violently spraying oil and ruptured lines can even cause fatal injuries.

We therefore recommend most strongly that these safety guidelines are strictly observed!

The owner of machines also bears a particular responsibility.

He is responsible for:

- Observance of the intended use of the hose lines
- Scheduled monitoring and systematic inspections by authorised personnel with the appropriate qualification and knowledge of hose line equipment
- Identifying and eliminating defects
- Scheduled replacement of hose lines

This active assumption of responsibility is enshrined in the legal framework. Based on the principles of industrial safety, the equipment and product safety act, the machine and pressure device directive and the ordinance on industrial safety and health, tasks are specified further and set out in procedural regulations for those concerned. Hydraulic hose lines are expressly mentioned in these regulations.

This guideline supplements the pertinent standards, guidelines and regulations which also have to be observed. It makes no claim to exhaustiveness.

1. ASSEMBLY

1.1 FUNDAMENTAL GUIDELINES FOR THE ASSEMBLY OF HOSE LINES

In order to ensure the safe function of hose lines and to avoid shortening their service lives by additional loads, the following requirements have to be satisfied:

- Hose lines may be assembled only by appropriately qualified personnel
- Hose lines must be installed in such a way that they are accessible at all times and are not obstructed in their natural position and movement
- Hose lines must generally not be subjected to tension, torsion or compression by external influences during operation
- The smallest bending radius of the hose stipulated by the manufacturer must not be exceeded
- Hose lines must be protected against damage caused by external mechanical, thermal or chemical influences
- Before starting operation, check separable connections for tightness
- Do not put the hose line into operation in the event of obvious external damage
- If necessary, clean the hose line in a suitable manner before starting operation
- For hose lines requiring equipotential bonding in accordance with TRBS 2153 (formerly BGR 132), check the equipotential bond and establish, if necessary
- The hose line length must be determined according to the installation conditions
- The possible shortening or lengthening under pressure indicated by the supplier or in the respective hose standard must be taken into consideration

Please note: Operation conditions with simultaneous maximum working pressure, maximum temperature and minimum bending radius shorten the service life of hose lines!

1.2 ADDITIONAL INFORMATION ON THE ASSEMBLY OF HOSE LINES

1.2.1 SELECTION OF THE HOSE LINE

The right choice of hose lines is of crucial importance for safe and cost-effective operation of a hydraulic system. Criteria for the choice and design of the hose line are:

- Resistance to the medium – and not forgetting the cleaning processes!
- Temperature resistance – check also the temperature/pressure behaviour!
- Special environmental conditions and influences from the outside
- Pressure resistance, including required safety margins (also vacuum behaviour)
- Nominal sizes and the resulting flow velocities
- Bending radii
- Changes in length and outside diameter
- Exceptional loads due to external forces or pressure surges
- Abrasion behaviour and possible protection
- Availability of the hose as yard goods and of the fittings
- Installation conditions, e.g. movements, kinking, whipping, marking, torque angle of elbow fittings, leg lengths
- Safe seal shapes (sealing head form)
- Demanded approvals

1.2.2 MEDIA COMPATIBILITY

The compatibility of the hose and fitting materials used with the media to be transported must always be tested. The surrounding media must also be taken into consideration in the selection.

1.2.3 TEMPERATURE AND ENVIRONMENT

The operating and also the ambient temperatures to be expected must be taken into consideration when selecting a hose line. If hose lines are used outside their permissible temperature range, a significant reduction in their service life is to be expected.

The rubber blends of the HANSA-FLEX Standard hydraulic hoses are generally set such that the hoses, depending on the configuration, are suitable for continuous operation in a temperature range from -40°C to max. $+100^{\circ}\text{C}$ (briefly up to $+120^{\circ}\text{C}$). The valid data can be found in the data sheets. Different temperatures apply for media differing from the standard application (e.g. compressed air or water).

At very low temperatures, rubber blends reach their "glass transition temperature". The glass transition temperature describes a temperature at which the elastic behaviour of the material is practically zero, i.e. the material becomes brittle and breaks like glass under mechanical load. A typical characteristic of a hose line destroyed by glass transition are fine radial cracks in the surface of the hose inner and outer layer. Operation at excessive temperatures also shortens the service life of a hose line, as rubber materials age prematurely as a result. However, the HANSA-FLEX product range also includes hose types for elevated temperature ranges.

Note also that the outer layer of a rubber hose is susceptible to environmental influences, such as ozone or strong UV radiation. Ozone and UV radiation can break down the chain molecules of the elastomer material. As a result, the material loses its elasticity. It becomes hard and brittle and breaks at points subject to higher loads, e.g. the outer radii. Characteristics of this behaviour are radial cracks that extend down to the braiding.

1.2.4 PERMISSIBLE PRESSURE

The maximum working pressure (dynamic working pressure) determines the structure and the choice of the hose. Depending on the application, hoses are available with textile braiding, with wire braiding, with wire spiral inserts or also as special hoses of metal or PTFE.

1.2.5 NOMINAL SIZES

In a hydraulic system, the hose or pipe inside diameter plays an important role. When a liquid flows through a line, it undergoes a pressure loss that depends on the type of flow, the roughness of the line inner wall, the line length, the inside diameter, the specific gravity of the liquid and its flow velocity. This applies for a continuous pipe flow. Also to be observed, however, is a "starting distance" which has a significant influence on the velocity distribution. Pressure losses also occur when the liquid flows through fittings, valves, elbows and other constrictions.

As a rule of thumb: In order to minimise losses, the inside diameter or free cross-section of the pipe / hose should be chosen large enough. If in doubt, decide in favour of the next-larger diameter. This reduces the flow velocity, and hence also the pressure losses in the line.

1.2.6 TORSION

If a hose line is installed so that it is twisted in itself, the service life is significantly reduced by the constant rubbing together of the plies. Under pressure pulses, the plies try to return to their neutral starting position. A particular load occurs in the area of the connection.

As an indicative value: A twist of 7° reduces the service life by 80%. Attention should therefore always be paid that the hose line is not twisted in itself, e.g. when tightening the union nuts.

1.2.7 MINIMUM BENDING RADIUS

A permissible bending radius is prescribed for each hose type, depending on its nominal size. If the minimum bending radius is exceeded, the service life and the load-bearing capacity of the hose line is reduced, as gaps can be caused in the wire mesh braiding on the outside of the bend due to the larger area to be covered. These can then result in violently spraying oil. On the inside of the bend, the opposite effect occurs: The plies are compressed and therefore no longer lie close enough to the inner layer of the hose and thus lose their pressure-bearing properties. Exceeding of the minimum bending radius occurs particularly immediately behind the connection when a hose is bent too sharply.

If the installation conditions allow, the bending of a hose line should start after a straight section with a length of 1.5 times the outside diameter. If necessary, kink protection or similar must be provided in such cases.

In some cases it is also possible to avoid exceeding the minimum bending radius by the use of suitable fittings.

Caution: Wildly spraying oil occurs when fine jets of oil penetrate the hose wall under high pressure. In such cases, switch off the machine immediately. On no account come into contact with these oil jets.

They can immediately penetrate the human skin and spread inside the body! Hydraulic fluids may be contaminated with bacteria which in such cases can result in serious or even fatal blood poisoning. Due to the small size and high pressure, such injuries are often not even painful.

Consult a doctor immediately if hydraulic oil has penetrated human tissue!

1.2.8 ABRASION

If a hose is laid over an edge, the outer layer can wear through due to the movement of the hose during operation.

The same applies to hoses that are laid too close together. The hoses rub against one another. The wire braiding is no longer protected against corrosion and failure of the hose is only a question of time. Should it not be possible to rule out abrasion, it is possible to use hoses with highly abrasion-resistant outer covers.

1.2.9 TENSILE LOAD

Tensile loads on hose lines must be avoided, as this endangers the secure connection to the fittings. Please note that hose lines can shorten under pressure (by up to 4% under maximum permissible working pressure), so that they should always be laid with a certain amount of slack. Possible movements of the hose lines must also be considered.

T

Note: With certain applications, e.g. spring-loaded tensioner rollers, tensile loads cannot be avoided. In such cases the permissible operational loads must be agreed upon with HANSA-FLEX.

1.2.10 HOSE HOLDERS

Hose holders should not be used where they hinder the natural movement and change in length of the hose. The outer layer will be destroyed in the long term by the rubbing movements in the holder. Hose holders should therefore only be installed on straight sections.

1.2.11 WHIPPING

If damage to a hose line is likely to present a hazard due to whipping, the hose line must be restrained or shielded. The hazardous whipping in the event of a hose line fracture can be prevented by design engineering measures. The HANSA-FLEX Stopflex safety system that permits a safe connection between hose and machine parts is particularly suitable for both proactive and subsequent installation.

1.2.12 LEAKS

If damage to a hose line creates a hazard due to the escape of the pressurised medium, the hose must be shielded.

1.2.13 COLD FLOW

Despite the chemical and physical cross-linking, creeping of the rubber material between nipple and fitting is also to be observed. This viscoelastic behaviour leads to leaks in the fitting area and to "wandering" of the hose fitting. Peeling of the upper rubber (outer layer) in the prescribed area can help to minimise this uncertainty factor at the hose.

1.2.14 GASES AND VAPOURS

When selecting the hose, attention must be paid to permeation or effusion, i.e. the possible wandering of the gas molecules through the inner layer. Media losses or undesirable concentrations of gases or gaseous fuels are the result. These gases are potentially flammable, explosive or toxic. A selective discharge of possible gas concentrations below the outer layer can be achieved by pricking, as employed e.g. for compressed air lines above 16 bar.

2. OPERATION

2.1 COMMISSIONING AND INTENDED USE OF HOSE LINES

Before commissioning, the tests prescribed by the relevant laws and directives (e.g. acceptance test, pressure test, etc.) and technical, organisational and personal protection measures have to be carried out. Technical and organisational measures always have priority. If all the hazards can nevertheless not be ruled out, effective personal protection equipment must be provided and used. The owner must test the suitability of the hose lines and their components with respect to the operating parameters, such as operating temperature, vacuum, pressure and material resistance. Where abrasion is possible, wear of the hose line must be assessed and examined.

2.2 STORAGE OF HOSE LINES

- Store cool, dry and away from dust. Protect from direct sunshine and/or UV radiation. Shield from nearby heat sources. Do not allow hoses and hose lines to come into contact with materials that could damage them
- Store hoses and hose lines horizontally in a stress-free and kink-free condition. When stored as rings, the radius must be not smaller than the minimum recommended by the manufacturer
- Hose ends must be sealed with caps to protect the inside of the hose from dirt, ozone and corrosion
- Maximum storage period in accordance with DIN 20 066 recommendations: 4 years for hose material and 2 years for hose lines
- Metal and PTFE hose lines must be protected in particular from exposure to chlorides, bromides, iodides and from rust

2.3 ADDITIONAL INFORMATION ON THE STORAGE OF HOSE LINES

2.3.1 GENERAL

Under unfavourable storage conditions or with improper handling, most products made from rubber change their physical properties. This can lead to a shortening of their service life. The changes can be caused by the effects of e.g. oxygen, ozone, heat, light, moisture, solvents or storage under strain. Properly stored and handled rubber products retain their properties almost unchanged over a long period of times (several years). The same does not apply, however, to non-vulcanised rubber blends.

2.3.2 STORAGE AREA

The storage area should be cool, dry, dust-free and moderately ventilated. Storage outdoors protected from the weather is not permitted. Solvents, fuels, lubricants, chemicals, acids, disinfectants, etc. must not be stored in the same area.

2.3.3 TEMPERATURE

The temperature for the storage of rubber products depends on the goods to be stored and the elastomers used. Rubber products should not be stored below -10°C and not above $+15^{\circ}\text{C}$. In exceptional cases the storage temperature may be as high as $+25^{\circ}\text{C}$ by agreement with the manufacturer. Higher temperatures are only permitted for short periods. In deviation from this, a storage temperature that must not be lower than $+12^{\circ}\text{C}$ may be required for rubber products made from certain rubber types, e.g. chloroprene rubber.

2.3.4 HEATING

In heated storage areas, the rubber products must be shielded from the heat source. The distance between heat source and stored goods must be at least 1 m. A larger distance is necessary for air-heated areas.

2.3.5 MOISTURE

The storage of rubber products in damp rooms should be avoided. Ensure that no condensation occurs. The relative humidity should preferably be below 65%.

2.3.6 LIGHTING

Rubber products should be protected from light, in particular from direct sunlight and strong artificial light with a high ultraviolet level. The windows of the storage areas should therefore be painted with a red or orange (on no account blue) protective coating. Lighting with normal bulbs should be preferred.

2.3.7 OXYGEN AND OZONE

Rubber products should be protected from air circulation, but particularly from draughts, by sheathing, by storage in airtight containers or by other means. This applies in particular to articles with a large surface area in relation to their volume, e.g. rubberised fabrics or cellular articles. As ozone is particularly harmful, the storage areas must contain no ozone-generating equipment, such as electric motors or other machines that may generate sparks or other electric discharges. Combustion gases and vapours that may result in the formation of ozone due to photochemical processes must be removed.

3. MAINTENANCE

3.1 INSPECTION INTERVALS FOR HOSE LINES

The inspection intervals for hose lines must be stipulated by the owner in accordance with the provisions of the Industrial Safety Regulation as part of the risk assessment according to § 3 BetrSichV. The safe working condition of hose lines must be tested by an authorised person in accordance with § 2 (7) of the Industrial Safety Regulation:

- Before commissioning
- At regular intervals after commissioning (recommended e.g. for thermoplastic and elastomer hose lines at least 1x per year. More severe loading due e.g. to higher mechanical, dynamic, thermal or chemical loads requires shorter inspection intervals)
- After a repair
- After major modifications (revamping) of the machine
- After accidents or after longer periods of non-operation

3.2 INSPECTION CRITERIA FOR HOSE LINES

The safety regulations for hydraulic hose lines from the Federation of Institutions for Statutory Accident Insurance and Prevention (HVBG) and the currently valid issue of DIN 20066 stipulate that the function of hose lines must be assessed at intervals to be stipulated.

The relevant rules clearly lay down the criteria for replacement of hose lines.

Hose lines must be replaced when during an inspection, the following damage is discovered:

- Damage to the outer layer down to the ply, e.g. by abrasion marks, cuts or cracks
- Brittleness of the outer layer or cracking of the hose material
- Deformations not consistent with the natural form of the hose or hose line, both in pressure-free and pressurised state or during bending (e.g. delamination or blistering)
- Leaks
- Damage or deformation of the hose fitting (sealing function impaired)
- Detachment of the hose from the fitting
- Fitting tightness and function impaired by corrosion
- Demands on the installation not observed (e.g. to DIN 20066)
- Storage and/or service period of the hose or hose line exceeded

3.3 REPAIR AND PAINTING OF HOSE LINES

A repair of the hose line involving the continued use of the installed hose and/or fitting (integration area) is not permitted. Recoating of hose lines violates the identification requirement.

3.4 ADDITIONAL INFORMATION ON THE MAINTENANCE OF HOSE LINES

3.4.1 CLEANING

Rubber products can be cleaned with soap or warm water. The cleaned articles must be dried at room temperature. After prolonged storage (6 to 8 months), the products can be cleaned using a 1.5% bicarbonate of soda solution. Rinse off the residues of the cleaning fluid with clean water. Effective and particularly gentle cleansing agents are recommended by the manufacturer. Solvents such as trichloroethylene, carbon tetrachloride and hydrocarbons must not be used for cleaning. The use of sharp objects, wire brushes, emery cloth, etc. is also forbidden for cleaning. Rubber/metal compounds should be cleaned with a glycerine/ethyl alcohol mixture (1:10). If disinfection is necessary, this should be carried out after thorough cleaning of the rubber products. The disinfectant must not be used at the same time as a cleansing agent. Pay attention to the compatibility with the rubber when selecting the disinfectant. Oxygen-releasing or halogen-releasing agents such as potassium permanganate or bleaching powder, in particular, can cause damage especially to thin-walled products. Only the disinfectants recommended by the manufacturer may be used for rubber products for medical applications. The serviceability of certain rubber products can be prolonged by a special coating (wax emulsion, shellac, etc.). Such coatings are not to be recommended for rubber products for medical applications. We should point out that special cleaning and storage processes are necessary in the case of demands for silicon-free materials.

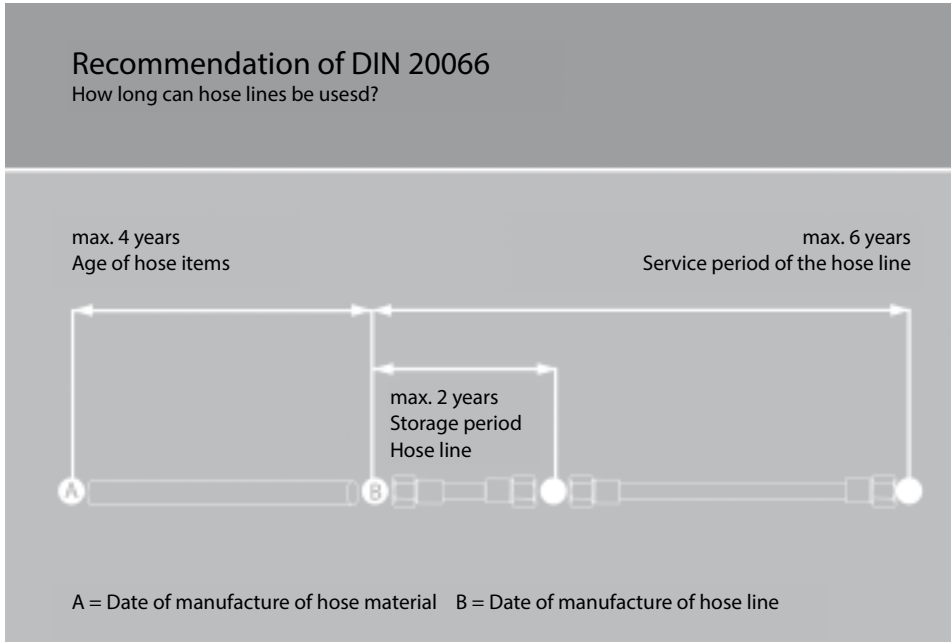

3.4.2 SERVICE PERIOD

The currently valid issue of DIN 20066 stipulates as follows:

Even with proper storage and admissible loading, hoses and hose lines are subject to natural ageing. Their service period is therefore limited. Improper storage, mechanical damage and overloading are the most frequent causes of failure. In individual cases, the service period can be defined on the basis of empirical values and in deviation from the following indicative values:

- During production of the hose line, the hose material should not be older than four years
- The service period of a hose line, including a possible storage period of the hose line, should not exceed six years
- The storage period of the hose line should therefore not exceed two years

The following diagram illustrates this principle:

In practice, hydraulic hoses are stored according to the First In-First Out (FIFO) principle. FIFO defines a storage principle where the date of storage determines the date of retrieval from storage. This means that the hose that has been in storage longest is retrieved from storage first.

Information on the storage and service periods of hose lines can be found in the following publications:

- DIN EN ISO 4413, point 5.4.6.5.1 - Hose lines (General requirements)
- DIN 20 066, point 14.1.2 - Storage and service period (recommendation)

Application:	Low and medium high pressure circuits, Return hoses
Standard:	EN 853 1 SN
Inner layer:	oil resistant synthetic rubber
Insert:	one high tensile steel wire braided insert
Outer layer:	synthetic rubber with high temperature, ozone and weather resistance
Colour:	black
Temp. min.:	-40 °C
Temp. max.:	100 °C
Elongation:	+ 2 % to - 4 %
Media:	Mineral oil, Polyglycol based oil, Water (0°C to +70°C), Water-oil emulsions

Note: The change in length of the hose is determined at max. working pressure during testing to EN ISO 1402.

TBF 200 CU**HD hose, type TBF, copper braid**

Application:	Electrically conductive paint spraying hose with high flexibility and low weight
Special features:	with copper braid, favourable flow properties, high resistance to light, weathering, aging, chemical media
Inner layer:	Polyamide
Insert:	two polyester braided inserts with interwoven copper braid for dissipating electrostatic charge
Outer layer:	NW 4: Polyamide; from NW 6: Polyurethane
Colour:	black
Temp. min.:	-60 °C
Temp. max.:	80 °C

FBS**Silicate fabric heat protection hose**

- Application:** Foundries, steelworks, glassworks, shipyards etc.
Properties: excellent resistance to liquid metals, flying sparks, dross, resistant against oils, greases and solvents
Application: as contact protection for hot and cold hoses, for protection in the high temperature range,, also particularly against liquid metals and splashed metal in the iron industry
Colour: bluish
Temp. min.: -25 °C
Temp. max.: 750 °C
Material: Calcium silicate fibres
Description: Abrasion resistant and tear proof insulating fabric, asbestos free, loss on ignition approx. 2%, good insulating properties due to low heat storage

Product versions:

PN FS MG - Swage nipple, BES, Brass

PN FS VA - Swage nipple, BES, Stainless steel

PN FS 45**Swage nipple, BES angle 45°**

Application:	Swage nipple for HD 100 to HD 400, KP and TE hoses
Connection 1:	Pipe sockets
Sealing form 1:	Cutting ring connection
Short code:	BES
Standard:	ISO 8434-1
Series:	heavy
Material:	Steel
Surface:	electro galvanised

Note: Final cutting ring assembly must be carried out in the hardened pre-assembly socket (VOM...). Choose the appropriate ferrule based on the hose type. Do not use for new designs; we recommend: PN...AOS...45.

PN WEO S 45

Swage nipple, WEO S angle 45°

- Application:** Swage nipple for HD 100 to HD 400, KP and TE hoses
- Connection 1:** WEO plug
- Sealing form 1:** O-ring sealed pin
- Material:** Steel
- Surface:** electro galvanised
- Description:** Self-aligning to prevent torsional stress.

PA 500 SF 45 VA - Swage fitting, SFL angle 45°, Stainless steel

PA 500 SF 90 A**Swage fitting, SFL angle 90°**

Application: Swage fitting for HD 500 hoses
Connection 1: SAE flange connection 3000 PSI
Sealing form 1: flat seal with SF O-ring
Short code: SFL
Standard: SAE J518, ISO 6162-1
Integration: with pull-out protection (interlock)
Included in scope of supply: Swage nipple + swage ferrule
Material: Steel
Surface: electro galvanised

AKM HL ME**Quick release coupling sleeve**

Application:	Meiler automotive engineering
Connection 1:	metric cylindrical outer thread
Sealing form 1:	24° inner cone
Included in scope of supply:	with dust protection
Temp. range:	Mineral oil -30° C to 100° C, Vegetable oil -15° C to 80° C
Material:	Steel
Surface:	electro galvanised
Description:	Quick release couplings uncouple automatically under excessive tensile load, preventing separation of the hose lines.

AKM IM ME**Quick release coupling sleeve**

Application:	Meiler automotive engineering
Connection 1:	metric cylindrical inner thread
Sealing form 1:	for screw-in pins with shapes A, B and if necessary E
Included in scope of supply:	with dust protection
Temp. range:	Mineral oil -30° C to 100° C, Vegetable oil -15° C to 80° C
Material:	Steel
Surface:	electro galvanised
Description:	Quick release couplings uncouple automatically under excessive tensile load, preventing separation of the hose lines.

Application:	General application, e.g. in industry, construction machinery, agricultural technology etc.
Connection 1:	metric cylindrical outer thread
Sealing form 1:	24° inner cone
Residual pressure:	Coupling under residual pressure is possible
Material:	Steel
Surface:	electro galvanised
Description:	Screw couplings are designed for high pressures and pressure pulses.

Product versions:

SKL IR - Screw coupling (loose), Steel, electro galvanised

Accessories:

SKL ZUBS - Dust protection for SKL

SKL IM AE**Screw coupling (loose)**

Application:	General application, e.g. in industry, construction machinery, agricultural technology etc.
Connection 1:	metric cylindrical inner thread
Sealing form 1:	for screw-in pins with shapes A, B and if necessary E
Residual pressure:	Coupling under residual pressure is possible
compatible with:	Aeroquip
Material:	Steel
Surface:	electro galvanised
Description:	Screw couplings are designed for high pressures and pressure pulses.

SKL IR E**Screw coupling (loose)**

Application: Automotive engineering
Connection 1: BSP cylindrical internal threads
Sealing form 1: for screw-in pins with shapes A, B and if necessary E
Material: Steel
Surface: electro galvanised
Description: Screw couplings are designed for high pressures and pressure pulses. Can be coupled with up to 100 bar residual pressure on one side and up to 50 bar residual pressure on both sides.

SKL IR RO**Screw coupling (loose)**

Application:	Hydraulic hammers, rams etc.
Connection 1:	BSP cylindrical internal threads
Sealing form 1:	for screw-in pins with shapes A, B and if necessary E
Material:	Steel
Surface:	electro galvanised
Description:	This coupling has been specially designed for use in the toughest conditions and can withstand severe vibrations and compression. The inner parts can be replaced when worn (repair possible).

Note: To prevent the hexagonal nuts from coming loose if vibrations occur, they must be securely tightened with a flat spanner.

Plug-in coupling sleeve

- Application:** General application, e.g. in industry, construction machinery, agricultural technology etc.
- Connection 1:** metric cylindrical outer thread
- Sealing form 1:** 24° inner cone
- Standard:** complies with ISO 7241-1 Series A
- Material:** Steel
- Surface:** electro galvanised
- Description:** The sliding sleeve can be fitted in a bulkhead wall with snap rings and then acts as a quick release coupling. The double acting sliding sleeve provides a push/pull function when coupling. Plug-in couplings allow quick coupling.

- Application:** General application, e.g. in industry, construction machinery, agricultural technology etc.
- Connection 1:** BSP cylindrical internal threads
- Sealing form 1:** for screw-in pins with shapes A, B and if necessary E
- Standard:** complies with ISO 7241-1 Series A
- Material:** Steel
- Surface:** electro galvanised
- Description:** The sliding sleeve can be fitted in a bulkhead wall with snap rings and then acts as a quick release coupling. The double acting sliding sleeve provides a push/pull function when coupling. Plug-in couplings allow quick coupling.

SKS IN SP

Plug-in coupling connector

Application:	General application, e.g. in industry, construction machinery, agricultural technology etc.
Connection 1:	NPT internal thread
Sealing form 1:	thread seal
compatible with:	Pioneer
Additional feature:	with ball valve
Material:	Steel
Surface:	electro galvanised
Description:	Plug-in couplings allow quick coupling.

SKM ZUB 3 11

Quick release clip with dust protection

suitable for: Plug-in coupling sleeve
Material: Steel

Identification	Size	Bulkhead thread	SW mm
SKM ZUB 3 11	3	M 48 x 1.5	55
SW = Width across flats			

Accessory for following products:

SKM IR - Plug-in coupling sleeve
 SKM HL / SKM HS - Plug-in coupling sleeve
 SKM IM - Plug-in coupling sleeve
 SKM IJ JD - Plug-in coupling sleeve

SKM ZUB 3 12**Quick release clip with spring**

suitable for: Plug-in coupling sleeve
Material: Steel

Identification	Size	Mounting hole mm
SKM ZUB 3 12	3	7,5

Spare parts:

SKM ZUB FEDER - Spring for SKM ZUB 312

Accessory for following products:

SKM HL / SKM HS - Plug-in coupling sleeve

SKM IJ JD - Plug-in coupling sleeve

SKM IM - Plug-in coupling sleeve

SKM IR - Plug-in coupling sleeve

SKM ZUBS 3 C**Dust protection coupling sleeve, SKM..**

suitable for: Plug-in coupling sleeve
Material: Plastic
Description: Snap-on dust protector (clip) for plug-in coupling sleeves. Available in various colours for marking cable systems.

Identification	Size	Colour
SKM ZUBS 3 C	3	red
SKM ZUBS 3 C BL	3	blue
SKM ZUBS 3 C GE	3	yellow
SKM ZUBS 3 C GR	3	green
SKM ZUBS 3 C SC	3	black

Accessory for following products:

SKM HL / SKM HS - Plug-in coupling sleeve
SKMS HL / SKMS HS - Plug-in coupling sleeve (bulkhead connection)
SKM U JD - Plug-in coupling sleeve
SKM IM - Plug-in coupling sleeve
SKM IR - Plug-in coupling sleeve

SKM ZUBS 3 CB**Dust protection coupling sleeve, SKM..**

- suitable for:** Plug-in coupling sleeve
Material: Plastic
Description: Snap-on dust protector (clip) for plug-in coupling sleeves. The cover includes a small hole for mounting an additional marking clip. The housing is available in various colours; the cover is always black.

Identification	Size	Colour
SKM ZUBS 3 CB	3	red
SKM ZUBS 3 CB SC	3	black

Accessories Accessory for following products:

SKM ZUB 3 M CLIP - Marking clip for SKM 3 C B

- Application:** General application, e.g. in industry, construction machinery, agricultural technology etc.
- Connection 1:** metric cylindrical outer thread
- Sealing form 1:** 24° inner cone
- compatible with:** Stucchi
- Material:** Steel
- Surface:** electro galvanised
- Description:** Flat seal plug-in coupling for minimal oil leakages and air admittance when coupling. For a high flow with minimal pressure loss. Suitable for use in environmentally sensitive areas.

Note: With standard threaded connections in determining the operating pressure of the maximum rated pressure is taken into account. Interchangeable with couplings to ISO 16028.

SKS IR 2 MULTI R**Multicoupling loose half, rectangular**

- Application:** Industry, Transport and municipal vehicles, Agricultural technology
- Connection 1:** BSP cylindrical internal threads
- Connection 2:** Connectors
- Standard:** complies with ISO 16028
- Residual pressure:** for coupling under residual pressure up to 40 bar on the plug side
- Design:** Multicoupling
- Supplementary design information:** Panel construction as quick-change system
- max: Flow:** 100 L/min
- Description:** Quick release couplings are used when add-on parts need to be replaced frequently.

Note: Working pressure: 200 bar for each coupling, but no more than 600 bar for the multicoupler

Identification	Connecting thread	Working pressure bar	Size
SKS 10 IR 2 MULTI R	G 3/8" -19	200	2
SKS 13 IR 2 MULTI R	G 1/2" -14	200	2

Additional info: Multi couplings offer considerable benefits

over bundled screw and plug-in couplings:

- Time saving factor due to fast and convenient exchange of add-on parts
- Convenient handling with simultaneous coupling of multiple connections
- Trouble-free coupling even if system pressures are applied
- No confusion between connections, no reversal of flow paths
- Flat seal valves prevent oil leakages, air admittance and allows efficient cleaning even in soiled working environments

SKS IR FS MULTI FL**Multi-coupling loose half flat**

Application:	construction plant
Connection 1:	BSP cylindrical internal threads
Connection 2:	Connectors
Residual pressure:	Coupling under pressure to approx. 200 bar
Design:	Multicoupling
Supplementary design information:	quick change system, 2 fold
Properties:	extremely flat - optimal mechanics, Stable design, high-strength and hardened materials, Modular construction, Couple with one throw of a lever
max: Flow:	90 L/min
Material:	Steel
Surface:	Zinc-nickel
Description:	Quick release couplings are used when add-on parts need to be replaced frequently.

DN = Nominal diameter, nominal width

PN MMA 90

Swage nipple, measuring hose angle 90°

Connection 1:

BSP nut thread with pressure gauge connection

Material:

Steel

Surface:

electro galvanised

Note: Appropriate ferrule: PMH 102.

DN = Nominal diameter, nominal width

PN 02 B**Swage nipple, RGN**

Application: Measuring equipment
Connection 1: Banjo for metric hollow screw
Sealing form 1: Sealed by copper ring
Short code: RGN
Standard: DIN 7642
Material: Steel
Surface: electro galvanised

Note: Appropriate ferrule: PMH 102.
